1.1 - Problem

Applying to internships involves keeping track of many deadlines and following up on them, as it can get very confusing trying to monitor this information on a spreadsheet. In fact, I usually miss deadlines and forget to reply to recruiters because I forget to check my spreadsheet. While trackers like Simplify exist, they are more useful for those applying for full-time roles and usually have financial barriers.

1.2 - Solution

I want to build a simple web app using Java, which allows me to record internship applications with details like company, role, date applied, status, and follow-up date that are all stored on a file. These applications will be updated as they go through the different stages, as it shows how many applications are in each stage. The app also provides alerts for applications that I have not heard back for a while so I know when to follow up.

2.2 - Tech Stack

- Languages: Java, HTML, CSS, JavaScript
- Libraries/Commands: Javalin, Gson, Bootstrap, Chart.js, java.time
- External Tools: GitHub, VS Code, Maven

2.3 - Chunked Build Plan

1. Set up the Git repo and a Maven project with Javalin and Gson
2. Get a Javalin server to run that depicts "Hello" in the browser
3. Create an Application class that includes company, role, date applied, status, and follow-up date, while saving these details to a JSON file with Gson
4. Build a form page to add a new application and save it to the JSON file
5. Display all applications in a table on the dashboard
6. Add the ability to update an application's status
7. Show the number of applications in each stage on the dashboard
8. Provide alerts for applications that are past their follow-up date or have no response after a certain number of days

3.1 - Repo Setup
